Introducing random point mutations into nucleic acods --
Introducing random point mutations into nucleic acods --
by prepn of single stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.
Disclosure; p; English.
Exandom point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules which terminate at all
possible nucleotide positions within a specified ragion. The
variable 3' ends generated in this way are used as primers for
reverse transcriptase. Nucleotides are misincorporated by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                              MK14

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59;

Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins promprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Disclosure; Page 35; 255pp; English.

Comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Coffee is a generic DNA Sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)1(TGC)(NNB)10(TGC)2(NNB)4Z(NNB)8(TGC)(NNB) 0.9Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in R65151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a contrained so that the expressed peptide contains 2 or 4 cysteine residues confer some degree of conformational rigidity to the peptides. They can also replace to the function of macromolecules, eg. residues confer some degree of conformational rigidity to the peptides. The TSARs or comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal cont, radiolsotope, peptide, toxin or enzyme, to the specific target or complex methods of hybridoma formation or in vivo antibody production.

Complex methods of hybridoma formation or in vivo antibody production.

Complex methods of hybridoma formation or in vivo antibody production.

Complex methods of hybridoma formation or in vivo antibody production.

Identifying proteins or peptide(s) which bind a ligand - by careening a recombinant vector library expressing fusion proteins recening a recombinant vector library expressing fusion proteins a recombinant vector library expressing fusion proteins promprising a binding domain and an effector domain proteins page 35; 255pp; English.

CC 070469 is a generic DNA sequence used to generate random TSAR peptide CT his generic formula can be represented as follows: X(TGC)(NNB)10-CC (TGC)(NNB)2(ZNNB)2(TGC)(NNB)14(TGC)) X and Y are flanking restriction sites (X is not the same as Y) that are not specific peptides restricted presence generic sequences are shown in 070465-68. Other specific peptides concatenated by these generic sequences are shown in R65150-54. TSARs are generated by these generic sequences are shown in R65150-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically a further comprise a linker peptide between the 2 domains. Contains 2 or 4 cysteine residues positioned in, or flanking, the contoins 2 or 4 cysteine residues positioned in, or flanking, the contoins and office of a TSAR binding domain can be used in vivo to deliver a chemically or belobogically active molety, eq. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eq. monoclonal or publication or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid represent and reperior and reperior and reperior and reperior and reperiors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Presenting a recombinant vector library expressing fusion proteins

PT comprising a blunding domain and an effector domain

PT screening a recombinant vector library expressing fusion proteins

PT comprising a blunding domain and an effector domain

Disclosure; Page 35; 255pp; English.

CC GMPG is a generic DNA sequence used to generate random TSAR (Totally

CS Synthetic Affility Reagents) peptides. This generic formula can also be

represented as follows: X(NNB)11(TC)(NNB)52(NNB)7(TG)(NNB)10Y. X

and Y are flanking restriction sites (X is not the same as Y) that are

CC offer specified further. Other generic sequences are shown in 707466-68.

CC other specific peptides generated by these generic sequences are shown in 685151-54. TSARs are concatenated heterofunctional proteins or peptides.

CC offer specified and a second effector peptide portion that is affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker of fainity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker of fainity for a ligand and a second effector peptide seals of seasigned so that the expressed peptide contains? The Olygonucleotides are also designed so that the expressed peptide contains 2 or 4 cyteine residues positioned in, or flanking, the unpredicted or variant residues. Therefore confer some degree of conformational rigidity to the peptides. The TSARs or comprise, peptide, toxin or enzyme, to the specific target or on the conformation or enzyme, to the specific target or on the conformation or enzyme, to the specific target or on the conformation of macromolecules, eq.

Cor compiex methods of hybridoma formation or in vivo antibody

CD concepted and rapid detection in a screening process.

Synthetic Affinity Reagents) peptides. This generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(MNB)11(TGC)(NNB)5(X) (NNB)5(X) (NRD)10(X) X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in 070466-68. Other specific peptides generated by these generic sequences are shown in 65151-54. TSARs are concatenated by these generic sequences are shown in 65151-54. TSARs are concatenated by these generic sequences are shown in 65151-54. TSARs are concatenated by these generic sequences are shown in 65151-54. TSARs are concatenated by these generic sequences are shown in 65151-54. TSARs are concatenated by these generic sequences are shown in 65151-54. TSARs are concatenated by these generic sequences are shown in 65151-54. TSARs are concatenated between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compans. comprising a TSAR binding domain can be used in vivo to radioisotope, peptide, toxin or enzyme, to the specific target or on the conformation of maching and also replace the function of macromolecules, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       which involves the topical administration of an essentially adenosine free antisense oligonuclectide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonuclectide specific for the human endothelin-1, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1527 GAAGCGGCGTTCGTTGTGCCTGGAGCCCCAGAGGCCTGGGGGGCACCAGCCGGCGCAGGCA 1468

Throducing random point mutations into nucleic acods -
by prepo of single stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.

Disclosure; p; English.

Exadom point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for variable 3' ends generated in this way are used as primers for temperateses and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which courred singularly in any given mutant.

CQ70467 is a generic DNA Sequence used to generate random TSAR (Totally

CQ 770467 is a generic DNA Sequence seed to generate formula can also be

represented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)1X

CG and Y are flanking restriction sites (X is not the same as Y) that are

CC other specified further. Other generic sequences are shown in Q70466-68.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 5 A; 10 C; 0 G; 0 T:

Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins

PT screening a recombinant vector library expressing fusion proteins

PT comprising a binding domain and an effector domain

Disclosure, Page 35; 255pp; English.

COMPAGE is a generic DNA Sequence used to generate random TSAR (Totally

COMPAGE is a generic DNA Sequence used to generate random TSAR (Totally

COMPAGE as follows: X(NNB)6(TGC)(NNB)12(NNB)14(TGC)(NNB)3Y. X

and Y are flanking restriction sites (X is not the same as Y) that are

COMPAGE as follows: X(NNB)6(TGC)(NNB)112(NNB)14(TGC)(NNB)3Y. X

and Y are flanking restriction sites (X is not the same as Y) that are

COMPAGE as generated by these generic sequences are shown in

COMPAGE as a ligand and a second effector peptide portion that is:

COMPAGE AS A ligand and a second effector peptide portion that is:

COMPAGE AS A ligand and a second effector peptide portion that is:

COMPAGE AS A lightly active. They may further comprise a linker

COMPAGE AS A lightly active. They may further comprise a linker

COMPAGE AS A lightly active and a lightly to the peptides. The TSARS

COMPAGE AS A lightly active moiety, eq. metal ion,

contains 2 or 4 cystein residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compens. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid
This generic formula can be represented as follows: X(TGC)(NNB)10-
(TGC)(NNB)2(ZTGC)(NNB)14(TGC)Y. X and Y are flanking restriction
sites (X is not the same as Y) that are not specified further. This
sequence generates peptides that are cloverleaf in structure. Other
generic sequences are shown in Q70465-68. Other specific peptides
generated by these generic sequences are shown in R65150-54. TSARs are
concatenated heterofunctional proteins or peptides, comprising at least
two functional regions - a binding domain with affinity for a ligand and
a second effector peptide portion that is chemically or biologically
active. They may further comprise a linker peptide between the 2 domains.
The oligonucleotides are also designed so that the expressed peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Sequence 13, Application US/08951733
Sequence 13, Application US/08951733
GENERAL INFORMATION:
APPLICANT: Harrington, Lea A.
APPLICANT: Robinson, Murray O.
TITLE OF INVENTION: NOVEL GENES ENCODING TELOMERASE PROTEINS
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:
ADDRESSEE: Amgen Inc.
STREET: One Amgen Center Drive
CITY: Thousand Oaks
STATE: CA

CURRENT APPLICATION DATA:
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/951,733
FILING DATE: 16-0CT-1997

Patent No. 5569830
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: BONNET, Alan
APPLICANT: POMELL, Ann
APPLICANT: PART INHIBITORS OF FUNGAL
TITLE OF INVENTION: PLANT INHIBITORS OF FUNGAL
TITLE OF INVENTION: POLYGALACTURONASES AND THEIR USE TO CONTROL FUNGAL DISEASE
NUMBER OF SEQUENCES: 24
CORRESPONDENCE ADDRESS:
